                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 889, Application US/09919580

Sequence 889, Application US/09919580

Patent No. US20020110832A1

GENERAL INFORMATION:

APPLICANT: Pyle, Ruth

APPLICANT: Av, Jiangchun

APPLICANT: Scrist, Heather

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY

TITLE OF INVENTION: AND DIAGNOSIS OF COLON CANCER

FILE REPERRINCE: 210121.552

CURRENT APPLICATION NUMBER: US/09/919,580

CURRENT FILING DATE: 2001-07-30

NUMBER OF SEQ ID NOS: 934

SOFTWARE: PastSEQ for Windows Version 4.0

SEQ ID NO 889

-!- FUNCTION: Ferritin is an intracellular molecule that stores iron in a Soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Shichijo S., Itoh K., "Itoh K., "Itoh K., "Identification of immuno-peptidmics that recognized by tumor-reactive CTL generated from TIL of colon cancer patients."; Submitted (MAY-2001) to the EMBL/GenBank/DDBJ databases.

depending on the species and tissue type.
MISCELLANEOUS: In human liver the heavy chain is the SIMILARITY: Belongs to the ferritin family.
SIMILARITY: Contains 1 ferritin-like diiron domain.
CAUTION: Ref.3 sequence differs from that shown due frameshift in position 175.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5; L.

Submitted (FEB-2004) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: Ferritin is an intracellular molecule that stores iron in a soluble, noncoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron core is deposited (By similarity).

-! SIMILARITY: Belongs to the ferritin family.

-! SIMILARITY: Contains 1 ferritin-like diiron domain.

EMBL: BC066341; AM+66441.1;

C -1- FUNCTION: Ferritin is an intracellular molecule that stores iron

in a soluble, nontoxic, readily available form. The functional

molecule, which is composed of 24 chains, is roughly spherical and

core is deposited (By similarity).

C -1- TISSUE SPECIFICTIV: Ubiquitous.

C -1- SIMILARITY: Contains 1 ferritin-like diiron domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. Submitted (JUL-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Ferritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron core is deposited (By similarity).
-!- SIMILARITY: Belongs to the ferritin family.
-!- SIMILARITY: Contains 1 ferritin-like diiron domain.

R. Submitted (OCT-2001) to the EMBL/Genbank/DDBJ databases.

C. -1- FUNCTION: Ferritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional contains a central cavity into which the polymeric ferrical and contains a central cavity into which the polymeric ferric iron molecule, which is composed of 24 chains, is roughly appearing to core is deposited (By similarity).

C. -1- SIMILARITY: Belongs to the ferritin-like diiron domain.

CC -1- SIMILARITY: Contains I ferritin-like diiron domain.

CC -1- SIMILARITY: Contains I ferritin-like diiron domain.

CC -1- SIMILARITY: Contains I ferritin-like diiron domain.

Submitted (AUG-2004) to the EMBL/GenBank/DDBJ databases.

Submitted (AUG-2004) to the EMBL/GenBank/DDBJ databases.

In a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron cortains a central cavity into which the polymeric ferric iron cortains a deposited (By similarity).

In SIMILARITY: Salongs to the ferritin family.

In SIMILARITY: Contains 1 ferritin-like diiron domain.

-!- FUNCTION: Ferritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               core is deposited.

MISCELLANBOUS: There are two types of ferritin subunits: L (light) chain and H (heavy) chain. The major chain can be light or heavy, depending on the species tissue type.

SIMILARITY: Belongs to the ferritin family.

SIMILARITY: Contains I ferritin-like diiron domain.

-!- FUNCTION: Ferritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             core is deposited.

MISCELLANEOUS: There are two types of ferritin subunits: L (light) chain and H (heavy) chain. The major chain can be light or heavy, depending on the species and tissue type.

SIMILARITY: Belongs to the ferritin family.

SIMILARITY: Contains 1 ferritin-like diiron domain.
Beaumont C., Dugast I., Renaudie F., Souroujon M., Grandchamp B.; "Transcriptional regulation of ferritin H and L subunits in adult erythroid and liver cells from the mouse. Unambiguous identification of mouse ferritin subunits and in vitro formation of the ferritin
                                                                                                                                                         Biol. Chem. 264:7498-7504(1989)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nature 420:563-573(2002).

Biol. Chem. 259:4327-4334(1984).
-!- FUNCTION: Perritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         core is deposited.

MISCELLANBOUS: There are two types of ferritin subunits: L (light) chain and H (heavy) chain. The major chain can be light or heavy, depending on the species and tissue type.

SIMILARITY: Belongs to the ferritin family.

SIMILARITY: Contains 1 ferritin-like diiron domain.
                                                                                                                                                                                                                              MEDLINE=88041121; PubMed=3478702;

Biochem. Biophys. 272:88-96(1989).
-!- FUNCTION: Ferritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE OF 71-101.

MISCELLANBOUS: There are two types of ferritin subunits: L (light) chain and H (heavy) chain. The major chain can be light or heavy, depending on the species and tissue type.

SIMILARITY: Belongs to the ferritin family.

SIMILARITY: Contains 1 ferritin-like diiron domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TISSUB=Brain;

DNA sequence coding for oncofetal ferritin 1 protein, useful for immunizatons against breast cancer, for enhancing fertilization rates during in vitro fertilization treatment and for use as a growth factor of bone-marrow progenitor cells.

Example 7; Fig 5; 66pp; English.

protein. OFFI has cytostatic, immunosuppressive, contraceptive, aborive and nootropic activities, and can be used as a vaccine. Compositions comprising the expression vector containing an OFFI coding sequence, and the OFFI protein, are useful: (a) for immunisations against cancer, The present sequence represents the human oncofetal ferritin 1 (OFF1)

The protein was isolated from a human lung cancer cell line, T3M-30Lu (FERM BP3120). The sequence of the protein was determined by amino acid sequencing following cleavage of the purified protein by V8 protease. The gene encoding this protein can be used to produce recombinant monocyte growth factor which can be used for stimulation of cellular immune function and
 especially breast cancer; (b) in the treatment of transplant rejections,
           autoimmune diseases, pathological pregnancies; (c) for enhancing fertilisation rates during in vitro fertilisation (IVF) treatment; and (d) for use as a growth factor of bone-marrow progenitor cells such as granulocyte monocytes. The OFF1 nucleotide sequence is useful for diagnosing cancer such as breast cancer, heptablastoma, leukaemia, Hodgkin's and non-Hodgkin's lymphomas and embryonal tumours, Down's Syndrome, and pathological pregnancies such as spontaneous abortion and miscarriage, premature contractions, toxaemia or premature delivery
